DETAILED ACTION

Allowable Subject Matter

Regarding claim 9, Agnoli et al. (US 2006/0294183) disclose transcoding services via a distributed network (abstract) including a client, a publishing service farm including a publishing service request processor and a collection of servers that provide the transcoding service, and a publisher, which is a source media content provider (Fig. 2; Fig. 3; Fig. 4A). A client initiates a request for media content ([0015]). The publishing service farm processes the request, retrieves the media contents, performs transcoding if necessary, and sends the transcoded media content to the users ([0030]). If the publishing service farm determines that the format of the media contents is supported by the client, it either directs the client to the original server or provides the media contents without transcoding ([0016]; [0091]).

As understood, Agnoli et al. do not disclose a unique feature recited by claim 9: "transferring compressed data from the digital audio/video disk to an electronic chip connected to the reception interface, the electronic chip connected to the reception interface, the electronic chip comprising main processing means for decoding the data if compressed according to the first compression standard, and an input/output interface supporting the predetermined data transfer rate, and if the data is compressed according to the second compression standard, then the electronic chip transfers the data through the input/output interface."

Claims 10-12 are allowable because they depend on claim 9 as discussed above.

Art Unit: 2621

Independent claims 13, 19, and 24 recite a similar feature as described in claim 9 above; thus, are also allowable.

Claims 14-18, 20-23, and 25-29 depend on independent claims 13, 19, and 24. For that reason, they are also allowable.
